AIRFLOW CALIBRATION UNIT

Part No: AFC-12 - Fitted

DESCRIPTION

The **AFC-12** unit has been developed to overcome a decrease in the sensitivity of some airflow meters, and to enhance the performance of others.

The **AFC-12** works in conjunction with the factory ECU and program to allow adjustments to the air/fuel ratio via the airflow signal.

NOTE : Most prefitted **AFC-12** units have been calibrated to standard specifications meaning adjustment should not be necessary. Use the instructions below if you require an air/fuel ratio which differs from factory settings.

ADJUSTMENT

If possible adjust in conjunction with a gas analyzer

The two pots will increase output voltage if turned clockwise.

Use the pot marked LOW to adjust the air/fuel ratio at idle.

Increase engine speed to 3000 rpm then alter pot marked high as necessary.

Return to idle and adjust low again.

Repeat this process if required to achieve desired results across range.

Warranty statement on reverse.
